                                                                                                                                                                                                                                                                                                                                                                                               New water-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus; Behoet's disease, aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. Claim 10; Page 45; 52pp; French.

The protein encoded by this sequence corresponds to the soluble, extracellular portion of the interferon-alpha and/or beta receptor. The transmembrane and cytoplasmic domains of the native receptor have been deleted to obtain a soluble, circulating form of the protein and the protein and cytoplasmic domains of the native receptor.
                                                                                                                                                                                                                                                                                                                                                        receptor. Potentially immunogenic epitopes have thus been eliminated See also Q14240.

In diseases and transplant rejection

Claim 10; Fig 1; 58pp; English.

DNA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate

Coligonuclectides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q3053), was incubated with oligos (200534 and Q30535. R28496 represents the complete receptor. R28495 captered and cytoplasmic domains. Both forms bind lacks the transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the toxic side-effects of known immunosuppressants such as steroids.

Q1-ApR-1994 (first entry)
Human interferon receptor extracellular domain coding sequence.
IFN-R; extracellular domain; monoclonal antibody; viral infection;
cell proliferation; allograft rejection; systemic lupus erythematosus;
psoriasis; multiple sclerosis; Behcet's Disease; aplastic anaemia;
immunodeficiency; measles virus; interferon-alpha-beta; ss.

PT Monoclonal antibody to human interferon type-I receptor - having pri neutralising activity against human type I interferon, used for PT neutralising activity against soluble forms of the human CC Unicologie and interferon alpha-beta receptor based on the full-length human IFN-R CC sequence are claimed. (See Q49624 for sequence coding for full-length IFN-R). The antibodies are useful for treatment and CC Inferferon and/or viral

                                                                                                                New water soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. Disclosure; Page 47; 52pp; French.

The protein encoded by this sequence corresponds to the complete interferon-alpha and/or beta receptor. The invention covers derivatives of the receptor obtained by deleting the transmembrar and cytoplasmic domains of the native receptor or by substitution see also 014239.

                                                                                                                                                                                                                                                                              water soluble polypeptide(s) strongly bind interferon(s) alpha and beta - useful as immunosuppressants, for treating auto:immune diseases and transplant rejection

In diseases and transplant rejection

Claim 10; Fig 2; S8pp; English.

DNA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate oligonucleotides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos Q30534 and Q30535. R28496 represents the complete receptor. R28495 clacks the transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the toxic side-effects of known immunosuppressants such as steroids. Sequence 1755 BP; 593 A; 325 C; 333 G; 504 T;

Disclosure; Fig 3; 21pp; English.
Monoclonal antibodies produced against soluble forms of the human interferon alpha-beta receptor based on the full-length human IFN-R sequence are claimed. (See Q49625 for sequence coding for soluble IFN-R, i.e. just the extracellular domain). The antibodies are useful for treatment and prophylaxis of disorders involving cell proliferation and/or viral infection.

Compsn. of monoclonal antibodies against interferon receptor useful as immuno:modulator, &g. for treating AIDS Disclosure; Fig. 38-2B; 105pp; English.

DNA encoding the extracellular domain of the human IFN class I receptor is given in Q86457; the full IFN receptor gene is given in Q86458. Immunomodulator monoclonal antibodies were raised against the recombinant soluble form of the extracellular domain (R71723) expressed in E. coli or COS cell hosts.

                                                                                                                                      New human alpha-interferon receptor protein - useful for testing interferon agonists and in treatment or diagnosis bisclosure; fig 4; 30pp; French.

This sequence encodes a recombinant human alpha interferon (IFN) receptor protein useful for the testing of IFN agonists and for treatment and diagnosis of viral diseases and tumours. Antibodies raised against this protein can be used for blocking the receptor when required, e.g. where overexpression of alpha-IFN is harmful. The Abs are also useful for e.g. drug targetting. Variants of the protein having residue 164 (Thr) replaced by Arg and an Asp inserted between residues 479 and 480, are also useful.

A cDNA sequence (T73519) corresponds to nucleotides 1260-1620 of a cDNA clone for human interferon alpha receptor (IFNAR, see also W21804), covering the region that codes for the transmembrane region of IFNAR. Differential splicing of INFAR gene transcripts (see also T73520 and T73521) produces novel soluble, non-membrane bound forms of IFNAR (see also W21805 and W21805) that can be used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exon

PT Treponema hyodysenteriae antigens - having molecular wt. of 3 PT and their DNA codes, and use for preparing vaccine.

PS claim 18; Page 49; 84pp; English.

CC The DNA includes family 1 contg. genes 1-4 encoding 39 kD an CC of T. hyo. The sequence was obtd. from clones isolated from CC of genomic library in lambda gtll. The antigens can be exp cand used to prepare vaccines to protect against swine dysent CC see also Q11378-Q11409.

CC See also Q11378-Q11409.

(MYCO) MYCOGEN CORP.
               New nucleic acid encoding B.thuringiensis toxin active against scarab(s) - also related toxin and transformed microbes, effective against adult pests and their larvae Example 3; Column 37-42; 24pp; English.

T43221-T43223 represent the coding sequences for toxins that are active against scarab pests. This sequence was isolated from the Bacillus thuringiensis strain toluvorthi. Insects in the family Scarabaddae constitute a serious pest control problem, especially when destructive larval stage insects infest high value turf found in golf courses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-JAN-1997 (first entry)
Antiscarab pest toxin 43F coding sequence.
